

## Frese EVA Highflow More water - less pressure loss

Frese EVA High valve combines dynamic balancing with on/off control valve. The Frese cartridge limits the flow to the specified rate, even under fluctuating pressure conditions, while the on/off actuator opens and closes the valve depend on the desired room temperature.

- Max differential pressure: 400 kPa
- Operating temp.: 0 til 95°C
- Dimensions: DN15-DN25
- Flow rate: Up to 2448 l/h
- Material: DZR brass
- Static pressure: PN25
- For cooling and heating applications

Frese EVA Highflow valves are comprised of an dynamic balancing valve and a two-port valve connected in series. Combining two different functions in a single product lowers cost, requires less space and reduces installation time. The high-quality materials guarantee maintenance-free and long-life operation.

For systems requiring on/off control, EVA Highflow valves are a simple and efficient way of maintaining room temperature.

Frese products efficiently balance HVAC systems worldwide. From heating systems in Scandinavia to cooling systems in the Middle East, Frese transforms state of the art technology into everyday solutions.
